DESCRIPTION

+ / -

An area of Medieval and Post Medieval ridge and furrow cultivation with two plough headlands are visible as earthworks, most of which have subsequently been destroyed by housing developments, on aerial photographs. The area included in this record measures a maximum of 710m long by up to 435m wide and is orientated north / south. It comprises a number of adjacent cultivation blocks with different orientations whose western side has been cut and is defined in this record by the course of the Post Medieval Honeybourne and Cheltenham branch railway (Linear 1802). The plough headlands comprise linear banks which flank the southern and northern sides of the northernmost cultivation block. Part of this northernmost cultivation block was still earthworks in 1988 but as it now forms a school playing field it may have been levelled. The sites of all of the other cultivation blocks included in this record are now occupied by housing and they are therefore assumed to have been destroyed. As the cultivation blocks are situated within Woodmancote parish they probably form part of that village's Medieval open field system together with other contemporary areas of ridge and furrow that are recorded separately (e.g. SO 92 NE 74).

MORE INFORMATION & SOURCES

+ / -

An area of Medieval and Post Medieval ridge and furrow cultivation with two plough headlands are visible as earthworks, which have subsequently been destroyed by housing developments, on aerial photographs. The area included in this record is centred at SO 9680 2734 and is bounded by SO 9655 2705, SO 9700 2697, SO 9702 2754 and SO 9666 2774. It measures a maximum of 710m long by up to 435m wide and is orientated north / south.

The area comprises a number of adjacent cultivation blocks with different orientations whose western side has been cut and is defined in this record by the course of the Post Medieval Honeybourne and Cheltenham branch railway (Linear 1802 / UID: 330838). The plough headlands comprise linear banks which flank the southern and northern sides of the northernmost cultivation block, between SO 9668 2751 and SO 9694 2743, and between SO 9673 2769 and SO 9696 2756. Part of this northernmost cultivation block around SO 9672 2758 was still earthworks in 1988 but as it now forms a school playing field it may have been levelled. The sites of all of the other cultivation blocks included in this record are now occupied by housing and they are therefore assumed to have been destroyed.

As the cultivation blocks are situated within Woodmancote parish they probably formed part of that villages Medieval open field system, As the cultivation blocks are situated within Woodmancote parish they probably form part of that villages Medieval open field system together with other contemporary areas of ridge and furrow that are recorded separately (e.g. SO 92 NE 74 / UID: 1410617). DESCRIPTION

+ / -

An area of Medieval and Post Medieval ridge and furrow cultivation with associated plough headlands and drainage ditches are visible as earthworks, some of which have subsequently been destroyed by housing developments, on aerial photographs. The area included in this record measures a maximum of 1860m long by up to 980m wide and is orientated north-east / south-west. It comprises a number of adjacent and separate cultivation blocks with different orientations, plus flanking and separate linear bank plough headlands and drainage ditches, all of which are situated within the parish of Woodmancote and probably form part of that village's Medieval open field system, together with other contemporary areas of ridge and furrow that are recorded separately (e.g. SO 92 NE 73). The very westernmost cultivation blocks were visible as extant earthworks on aerial photographs taken in 1947 but this area has subsequently been developed for housing and these blocks are assumed to have been destroyed. The remaining blocks are visible as earthworks or cropmarks where they have been ploughed.

MORE INFORMATION & SOURCES

+ / -

An area of Medieval and Post Medieval ridge and furrow cultivation with associated plough headlands and drainage ditches are visible as earthworks, some of which have subsequently been destroyed by housing developments, on aerial photographs. The area included in this record is centred at SO 9795 2738 and is bounded by SO 9704 2695, SO 9742 2683, SO 9800 2674, SO 9810 2705, SO 9882 2731, SO 9888 2748, SO 9875 2777, SO 9853 2793, SO 9816 2792, SO 9730 2753, SO 9700 2757 and SO 9712 2725. It measures a maximum of 1860m long by up to 980m wide and is orientated north-east / south-west.

The area comprises a number of adjacent and separate cultivation blocks with different orientations, plus flanking and separate linear bank plough headlands and drainage ditches, all of which are situated within the parish of Woodmancote. They probably form part of Woodmancote's Medieval open field system, together with other contemporary areas of ridge and furrow that are recorded separately (e.g. SO 92 NE 73 / UID: 1410616), although they may also have been shared with Southam and Bishop's Cleeve. Three orchards are also situated near the village.

The very westernmost cultivation blocks, centred at SO 9714 2705, SO 9721 2734 and SO 9713 2749, were visible as extant earthworks on aerial photographs taken in 1947, but these areas have subsequently been developed for housing and these blocks are therefore assumed to have been destroyed. Many of the other cultivation blocks are visible as extant earthworks, or cropmarks where they have been ploughed. Ridge and furrow cultivation may also be evident beneath areas of solifluction on the slopes of Cleeve hill, for example around SO 9812 2768, SO 9831 2731 or SO 9799 2683. At SO 9776 2760 and SO 9845 2729 areas of solifluction have subsequently been included in the ridge and furrow cultivation. (1-5)

DESCRIPTION

+ / -

A Medieval and / or Post Medieval settlement site is visible as earthworks, which have subsequently been destroyed by housing development, on aerial photographs. The site extended over an area that measures 106m long by up to 92m wide and was orientated north / south. It comprised at least six conjoined rhomboid probable building platforms, which measure 17m across, a possible pond to their north and a hollow way immediately to their east. Other bank features include three incomplete short linear banks to their south, all orientated NNW / SSE with the rest of the site, that could represent toft boundaries. The site probably represents an element of the Medieval and / or Post Medieval settlement pattern of Bishop's Cleeve but has probably been destroyed by housing development in the later 20th century.

MORE INFORMATION & SOURCES

+ / -

A Medieval and / or Post Medieval settlement site is visible as earthworks, which have subsequently been destroyed by housing development, on aerial photographs. The site was centred at SO 9733 2748 and extended over an area that measured 106m long by up to 92m wide and was orientated north / south.

It comprised at least six conjoined rhomboid probable building platforms, each of which measures 17m across, a possible pond to their north at SO 9733 2752 and a hollow way or leat immediately to their east that measures just under 6m wide and extended between SO 9737 2746 and SO 9735 2751. Other banked features include three short linear bank sections situated around SO 9732 2744, all orientated NNW / SSE with the rest of the site, that could perhaps represent toft

boundaries.

The site probably represents an element of the Medieval and / or Post Medieval settlement pattern of Bishop's Cleeve but has probably been destroyed by the housing development of Beverley Gardens in the later 20th century. (1-3)

DESCRIPTION

+ / -

An area of Medieval and Post Medieval quarrying is visible as earthworks on aerial photographs. The site comprises a large number of curvilinear extractive pits and amorphous quarries, plus several interspersed spoil heaps, that extend over an area measuring a total of 971m long by up to 263m wide. The pits measure a minimum of 3m in diameter and the four largest quarries measure a maximum of 135m long by up to 57m wide. Two of these are situated next to the south-western end of the Iron Age Nottingham hill hillfort ramparts and may have been cut into them (see SO 92 NE 6). The quarries appear to be exploiting the Upper Lias geology exposed on the south-western flank of Nottingham hill and the site probably comprises pits dug over several centuries.

MORE INFORMATION & SOURCES

+ / -

An area of Medieval and Post Medieval quarrying is visible as earthworks on aerial photographs. The site comprises a large number of curvilinear extractive pits and amorphous quarries, plus several interspersed spoil heaps, that extend over an area centred at SO 9819 2804 that measures a total of 971m long by up to 263m wide and is orientated roughly WNW / ESE.

A group of pits around SO 9863 2796 each measure 3m to 4m in diameter and the four largest quarries, at SO 9858 2802, SO 9847 2805, SO 9817 2798 and SO 9790 2815, measure a maximum of 135m long by up to 57m wide. The first two of these are situated next to the south-western end of the Iron Age Nottingham hill hillfort ramparts and may have been cut into them (see SO 92 NE 6 / UID: 117615).

The quarries appear to be exploiting the Upper Lias geology exposed on the south-

western flank of Nottingham hill as marked on the geology map of this area and the site probably comprises pits dug over several centuries. The pits and quarries do follow a linear pattern that is similar to the iron-working scowles known from the Forest of Dean, hence the name "little skules" recorded by the SMR at this location, but the absence of an iron-rich band of crease limestone suggests that they were stone quarries rather than iron-workings.
